Closed Terrarium Care

Terrariums that are closed are self sufficient and environmentally friendly because they recycle water.

It's important to establish the right levels of humidity inside your terrarium so check it regularly. Never just pour water into the terrarium as this is likely to flood it and once water is in you can't take it out again very easily!

This type of terrarium does not need watering unless there is no condensation on the inside of the glass. Then give the inside 1 spray from a mister and close the terrarium again.

If however there is so much condensation that you cannot see the plants inside open the terrarium and let the fresh air in for a couple of days to allow excess water to evaporate before replacing the lid again.

Regularly turn the terrarium so that the plants grow evenly.

Keep in a well lit position but not in direct sunlight, since the container can act as a lens and burn your plants.

Enjoy your terrarium!
